Diagnosing Common Kenmore 110 Issues

Effective repair begins with accurate diagnosis. The following sections provide detailed diagnostic steps for typical problems.

1. Washer Won't Fill with Water

Diagnostic Steps:

- Check the water supply: Ensure both hot and cold water valves are open.
- Inspect inlet hoses: Look for kinks, clogs, or leaks.
- Test the water inlet valve: Use a multimeter to verify electrical continuity. Replace if faulty.
- Examine the lid switch: Since the washer won't operate if the lid switch is defective, test it for continuity when the lid is closed. Replace if malfunctioning.

2. Washer Agitates But Does Not Spin

Diagnostic Steps:

- Test the lid switch: If the switch isn't engaging, the washer may not spin due to safety interlock.
- Inspect the drive belt: Some models have a belt-driven transmission; check for cracks or looseness.
- Evaluate the motor coupling: Worn or broken couplings prevent spinning; replace if necessary.
- Check the timer control: Faulty timers can prevent the spin cycle from starting; test with a multimeter.

3. The Washer Leaks Water

Diagnostic Steps:

- Inspect door seals or tub seals: Look for tears, cracks, or buildup that can cause leaks.
- Check drain hose connections: Tighten fittings and clear blockages.
- Verify water level: Overfilling can cause leaks; adjust fill levels if adjustable.

- Test the water inlet valve: A damaged valve may leak internally; replace if needed.

4. Excess Noise During Operation

Diagnostic Steps:

- Examine the drum bearings: Worn bearings produce grinding sounds; replace if necessary.
- Check for foreign objects: Coins or debris can be caught in the agitator or pump.
- Inspect the suspension components: Worn shocks or supports can cause banging.
- Assess the drum and motor alignment: Misalignment can lead to unusual noises.
